"reasoning": "We need to output Selenium Java code that extracts the given DOM elements (presumably locate them) without using ID if the ID contains a number. The IDs have numbers: createLeadForm_companyName (no number), createLeadForm_lastName (no number), createLeadForm_firstName (no number), ext-gen630 (has number). So we should not use ID for the last one (submit button). Use other locators: maybe By.name, By.cssSelector, By.xpath, By.className, etc.\n\nWe need to \"Extract the below given DOM\" - maybe they want to locate and retrieve values? Provide code that finds elements and maybe prints their values. Provide only Java code, no explanations.\n\nThus produce a Java class with main method, WebDriver setup, locate elements using appropriate locators, maybe send keys or click. Provide code only.\n\nWe'll avoid ID for the submit button; use By.cssSelector(\"input.smallSubmit[value='Create Lead']\") or By.xpath(\"//input[@type='submit' and @value='Create Lead']\"). For others, we can use By.name or By.cssSelector with class and name.\n\nLet's produce code:\n\nWebDriver driver = new ChromeDriver();\ndriver.get(\"url\");\nWebElement companyName = driver.findElement(By.name(\"companyName\"));\nWebElement lastName = driver.findElement(By.name(\"lastName\"));\nWebElement firstName = driver.findElement(By.name(\"firstName\"));\nWebElement createLeadBtn = driver.findElement(By.xpath(\"//input[@type='submit' and @value='Create Lead']\"));\n\nThen maybe print attributes.\n\nWe'll just output code snippet.\n\nMake sure not to include explanations. Provide only Java code."
